

Engineered Hardwood Flooring Maintenance

Requires the same cleaning methods as any other type of wood flooring. See below step by step tips for taking care of your engineered floors:

- Keep your engineered flooring swept, clean, and dry on a daily basis.
- Use either a vacuum cleaner with a soft flooring attachment, or a broom. Don't use vacuums with a beater bar or power rotary brush head.
- A dry microfiber dust mop can be used to pick up dirt and debris from the floor.
- Spills must be wiped up as soon as they occur. Excessive water or liquid can cause irreversible damage to engineered hardwood flooring. Wipe up spills and spots immediately.
- Bona or equivalent "Hardwood Flooring Cleaner" as needed for regular maintenance.
- You can also keep pebbles, dirt, moisture, grains of sand, fragments of glass, and debris away by keeping floor mats and rugs at all entrances. This will help keep the upper wear layer and finish of your floor safe and intact for a longer period of time.
- Avoid walking on your floors with high heeled shoes or shoes with spikes because they can cause severe damage to the upper wear layer of the floor.
- Wax-based cleaners, harsh detergents, or steel wool should not be used to clean engineered hardwood flooring. Do not use oil soaps, liquid or paste wax or other household products containing lemon, citrus, tung oil or silicon to clean floors.

Contact your local Retailer, Distributor or Cleaning Professional with any additional questions, concerns or maintenance products.
